

Mobile Phone Sanitizer 3-months-protection

Application

1. Wipe the phone or surface to be protected with a tissue to remove fingerprints etc.
2. Open a wipe and use one side of the wipe to clean the surface, then turn the wipe over and continue to wipe the surface, ensuring full coverage. The surface will look a little smeared at this point. Continue wiping the tissue over the surface for approximately 30 seconds. This action ensures that the phone is fully sanitised and also fully coated.
3. Allow the coating to dry for 2-3 minutes and then gently buff the surface with a clean cloth, micro-fibre or tissue. After this action your device will be sanitised and protected for approximately one week.

With the continued application of the coating a super thin layer of anti-pathogen liquid glass technology is deposited on the surface. After drying, this active layer will continue to kill the pathogens which are deposited on the surfaces; in addition the surface becomes easy-to-clean. This easy-to-clean characteristic increases after several days and also over the following months as each application will create a slightly thicker deposit of active liquid glass.

Product features

- Unique Long Term Phone Sanitizer
- neutralizes pathogens (Bacteria, Viruses and Fungi)
- quick and easy-to-apply
- easy-to-clean
- provides a super smooth surface
- Medical Grade technology, used in hospitals throughout the world
- prevents re-contamination
